# Exponential Convergence for Functional SDEs with Hölder Continuous Drift 

Xing Huang<br>Center for Applied Mathematics, Tianjin University, Tianjin 300072, China<br>xinghuang@tju.edu.cn

October 20, 2018

#### Abstract

Applying Zvonkin's transform, the exponential convergence in Wasserstein distance for a class of functional SDEs with Hölder continuous drift is obtained. This combining with log-Harnack inequality implies the same convergence in the sense of entropy, which also yields the convergence in total variation norm by Pinsker's inequality.

AMS subject Classification: 60H10, 60B10.
Keywords: Functional SDEs, Zvonkin's transform, Hölder continuous, Exponential convergence, Wasserstein distance.

## 1 Introduction

Consider the SDE on $\mathbb{R}^{d}$

$$
\begin{equation*}
\mathrm{d} X(t)=b(X(t)) \mathrm{d} t+\mathrm{d} W(t), \tag{1.1}
\end{equation*}
$$

where $b: \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}$, $W$ is a $d$-dimensional Brownian motion on some complete filtration probability space. If the dissipative condition

$$
\langle b(x)-b(y), x-y\rangle \leq-\kappa_{0}|x-y|^{2}, \quad x, y \in \mathbb{R}^{d}
$$

holds for some $\kappa_{0}>0$, then $\operatorname{SDE}$ (1.1) has a unique solution and the associated semigroup has exponential convergence in Wasserstein distance. In [1, 2], the exponential convergence in the sense of Wasserstein distance and total variation norm has been obtained
for a class of functional SDEs/SPDEs with regular coefficients and additive noise, where exponential convergence in total variation norm is proved due to the gradient- $L^{2}$ estimate

$$
\left|\nabla P_{t} f\right|^{2} \leq C P_{t}|f|^{2}, \quad t>r_{0}, f \in \mathscr{B}_{b}(\mathscr{C}),
$$

see [1, 2] for more details. Recently, using Zvonkin's transform [16], the strong wellposedness of SDEs is proved for SDEs with singular drifts, see [4, 9, 12, 13, 14, 15]. For the functional SDEs with singular drift, [5] proved the existence and uniqueness. In infinite dimension, $[6,8]$ obtain the existence and uniqueness of the mild solution for a class of semi-linear functional SPDEs with Dini continuous drift and establish the Harnack inequality.

Recall that for two probability measures $\mu, \nu$ on some measurable space $(E, \mathscr{F})$, the entropy and total variation norm are defined as follows:

$$
\operatorname{Ent}(\nu \mid \mu):= \begin{cases}\int\left(\log \frac{\mathrm{d} \nu}{\mathrm{~d} \mu}\right) \mathrm{d} \nu, & \text { if } \nu \text { is absolutely continuous with respect to } \mu, \\ \infty, & \text { otherwise }\end{cases}
$$

and

$$
\|\mu-\nu\|_{v a r}:=\sup _{A \in \mathscr{F}}|\mu(A)-\nu(A)| .
$$

By Pinsker's inequality (see $[3,10]$ ),

$$
\begin{equation*}
\|\mu-\nu\|_{v a r}^{2} \leq \frac{1}{2} \operatorname{Ent}(\nu \mid \mu), \quad \mu, \nu \in \mathscr{P}(E) \tag{1.2}
\end{equation*}
$$

here $\mathscr{P}(E)$ denotes all probability measures on $(E, \mathscr{F})$. Indeed, these two estimates correspond to the log-Harnack inequality for the associated semigroups, see Lemma 2.1 below for details.

When $E$ is a Polish space, in particular, $E=\mathscr{C}$ in our frame, which will be defined in the sequel, let

$$
\mathscr{P}_{2}:=\left\{\mu \in \mathscr{P}(\mathscr{C}): \mu\left(\|\cdot\|_{\infty}^{2}\right)<\infty\right\} .
$$

It is well known that $\mathscr{P}_{2}$ is a Polish space under the Wasserstein distance

$$
\mathbb{W}_{2}(\mu, \nu):=\inf _{\pi \in \mathrm{C}(\mu, \nu)}\left(\int_{\mathscr{C} \times \mathscr{C}}\|\xi-\eta\|_{\infty}^{2} \pi(\mathrm{~d} \xi, \mathrm{~d} \eta)\right)^{\frac{1}{2}}, \quad \mu, \nu \in \mathscr{P}_{2}
$$

where $\mathbf{C}(\mu, \nu)$ is the set of all couplings of $\mu$ and $\nu$. Moreover, the topology induced by $\mathbb{W}_{2}$ on $\mathscr{P}_{2}$ coincides with the weak topology.

The purpose of this paper is to establish the exponential convergence in the sense of Wasserstein distance, the entropy and total variation norm respectively for functional SDEs with Hölder continuous drift, which is much weaker than the Lipschitz condition.

Throughout the paper, we fix $r_{0}>0$ and consider the path space $\mathscr{C}:=C\left(\left[-r_{0}, 0\right] ; \mathbb{R}^{d}\right)$ equipped with the uniform norm $\|\xi\|_{\infty}:=\sup _{\theta \in\left[-r_{0} .0\right]}|\xi(\theta)|$. For any $f \in C\left(\left[-r_{0}, \infty\right) ; \mathbb{R}^{d}\right)$,
$t \geq 0$, let $f_{t}(s)=f(t+s), s \in\left[-r_{0}, 0\right]$. Then $f_{t} \in \mathscr{C} .\left\{f_{t}\right\}_{t \geq 0}$ is called the segment process of $f$. Consider the following functional SDE on $\mathbb{R}^{d}$ :

$$
\begin{equation*}
\mathrm{d} X(t)=A X(t) \mathrm{d} t+\left\{b(X(t))+B\left(X_{t}\right)\right\} \mathrm{d} t+\sigma \mathrm{d} W(t) \tag{1.3}
\end{equation*}
$$

where $W(t)$ is a $d$-dimensional Brownian motion on a complete filtration probability space $\left(\Omega,\left\{\mathscr{F}_{t}\right\}_{t \geq 0}, \mathscr{F}, \mathbb{P}\right), \sigma \in \mathbb{R}^{d} \otimes \mathbb{R}^{d}$, and

$$
b: \mathbb{R}^{d} \rightarrow \mathbb{R}^{d}, \quad B: \mathscr{C} \rightarrow \mathbb{R}^{d}
$$

are measurable.
The remainder of the paper is organized as follows. In Section 2 we summarize the main results of the paper; In section 3, we give precise estimate for Zvonkin's transform and the main results are proved in Section 4.

## 2 Main Results

Throughout this paper, we make the following assumptions:
(H1) $\sigma$ is invertible and $b$ is bounded, i.e.

$$
\begin{equation*}
\|b\|_{\infty}<\infty \tag{2.1}
\end{equation*}
$$

Moreover, there exist constants $\kappa>0$ and $\alpha \in(0,1)$ such that

$$
\begin{equation*}
|b(x)-b(y)| \leq \kappa|x-y|^{\alpha}, \quad x, y \in \mathbb{R}^{d} . \tag{2.2}
\end{equation*}
$$

(H2) $A$ is a negative definite self-adjoint operator and there exists $\lambda_{1} \leq \lambda_{2} \leq \cdots \leq \lambda_{d}$ such that $A e_{i}=-\lambda_{i} e_{i}, i=1,2, \cdots, d$. Furthermore,

$$
\begin{equation*}
\|B\|_{\infty}<\infty, \quad|B(\xi)-B(\eta)| \leq \lambda_{B}\|\xi-\eta\|_{\infty}, \quad \xi, \eta \in \mathscr{C} \tag{2.3}
\end{equation*}
$$

for some constant $\lambda_{B}>0$.
Since Hölder continuity is stronger than Dini continuity, according to [8, Theorem 2.1] for $\mathbb{H}=\mathbb{R}^{d}$, under (H1) and (2.3), the $\operatorname{SDE}$ (1.3) has a unique non-explosive solution denoted by $X_{t}^{\xi}$ with $X_{0}=\xi$ and

$$
\begin{equation*}
\mathbb{E} \sup _{t \in[0, T]}\left\|X_{t}^{\xi}\right\|_{\infty}<\infty, \quad T>0 \tag{2.4}
\end{equation*}
$$

Let $P_{t}(\xi, \mathrm{~d} \eta)$ be the distribution of $X_{t}^{\xi}$, and

$$
P_{t} f(\xi):=\int_{\mathscr{C}} f(\eta) P_{t}(\xi, \mathrm{~d} \eta), \quad f \in \mathscr{B}_{b}(\mathscr{C})
$$

Moreover, for any $\nu \in \mathscr{P}_{2}$, let $\nu P_{t}=\int_{\mathscr{C}} P_{t}(\xi, \cdot) \nu(\mathrm{d} \xi)$. Then $\nu P_{t}$ is the distribution of the solution $X_{t}$ to (1.3) from initial distribution $\nu$.

The lemma below gives the estimate of $\operatorname{Ent}\left(P_{t}(\xi, \cdot) \mid P_{t}(\eta, \cdot)\right)$ and $\left\|P_{t}(\xi, \cdot)-P_{t}(\eta, \cdot)\right\|_{\text {var }}$ respectively.

Lemma 2.1. Assume (H1) and (2.3). Then the log-Harnack inequality holds, i.e.

$$
\begin{equation*}
P_{t} \log f(\eta) \leq \log P_{t} f(\xi)+\frac{C(t)}{\left(t-r_{0}\right) \wedge 1}\|\xi-\eta\|_{\infty}^{2}, \quad t>r_{0}, \xi, \eta \in \mathscr{C}, f \in \mathscr{B}_{b}^{+}\left(\mathbb{R}^{d}\right) \tag{2.5}
\end{equation*}
$$

for some function $C:\left(r_{0}, \infty\right) \rightarrow(0, \infty)$. Thus, for any $t>r_{0}, P_{t}(\xi, \cdot)$ is equivalent to $P_{t}(\eta, \cdot)$. Moreover,

$$
\begin{equation*}
\operatorname{Ent}\left(P_{t}(\xi, \cdot) \mid P_{t}(\eta, \cdot)\right)=P_{t}\left\{\log \frac{\mathrm{~d} P_{t}(\xi, \cdot)}{\mathrm{d} P_{t}(\eta, \cdot)}\right\}(\xi) \leq \frac{C(t)}{\left(t-r_{0}\right) \wedge 1}\|\xi-\eta\|_{\infty}^{2} \tag{2.6}
\end{equation*}
$$

and

$$
\begin{equation*}
\left\|P_{t}(\xi, \cdot)-P_{t}(\eta, \cdot)\right\|_{v a r}^{2} \leq \frac{C(t)}{2\left(t-r_{0}\right) \wedge 2}\|\xi-\eta\|_{\infty}^{2} \tag{2.7}
\end{equation*}
$$

Proof. The log-Harnack inequality (2.5) is a known result in [8, Theorem 2.2] with $\mathbb{H}=\mathbb{R}^{d}$, see also [7, Theorem 2.4] for log-Harnack inequality of the path-distribution dependent SDEs with Dini continuous drift. Combining the definition of $\operatorname{Ent}\left(P_{t}(\xi, \cdot) \mid P_{t}(\eta, \cdot)\right)$ and [11, Theorem 1.4.2], we obtain (2.6). Finally, (2.7) follows from (1.2) and (2.6).

Remark 2.2. For any $\nu, \tilde{\nu} \in \mathscr{P}_{2}$ and $\pi \in \mathbf{C}(\nu, \tilde{\nu})$, taking expectation on both sides of (2.5) with respect to $\pi$, we have for any $t>r_{0}$,

$$
\int_{\mathscr{C}^{2}} P_{t} \log f(\eta) \pi(\mathrm{d} \xi, \mathrm{~d} \eta) \leq \int_{\mathscr{C}^{2}} \log P_{t} f(\xi) \pi(\mathrm{d} \xi, \mathrm{~d} \eta)+\frac{C(t)}{\left(t-r_{0}\right) \wedge 1} \int_{\mathscr{C}^{2}}\|\xi-\eta\|_{\infty}^{2} \pi(\mathrm{~d} \xi, \mathrm{~d} \eta)
$$

Jensen's inequality and the definition of $\mathbb{W}_{2}$ imply that

$$
\begin{equation*}
\left(\tilde{\nu} P_{t}\right)(\log f) \leq \log \left(\nu P_{t}\right)(f)+\frac{C(t)}{\left(t-r_{0}\right) \wedge 1} \mathbb{W}_{2}(\nu, \tilde{\nu})^{2}, \quad t>r_{0} \tag{2.8}
\end{equation*}
$$

Then we have

$$
\begin{equation*}
\operatorname{Ent}\left(\nu P_{t} \mid \tilde{\nu} P_{t}\right) \leq \frac{C(t)}{\left(t-r_{0}\right) \wedge 1} \mathbb{W}_{2}(\nu, \tilde{\nu})^{2}, \quad t>r_{0} \tag{2.9}
\end{equation*}
$$

and

$$
\begin{equation*}
\left\|\nu P_{t}-\tilde{\nu} P_{t}\right\|_{v a r}^{2} \leq \frac{C(t)}{2\left(t-r_{0}\right) \wedge 2} \mathbb{W}_{2}(\nu, \tilde{\nu})^{2}, \quad t>r_{0} \tag{2.10}
\end{equation*}
$$

The main result in this paper is the following theorem.
Theorem 2.3. Assume (H1)-(H2), and let

$$
\begin{equation*}
\lambda_{0}=\left(3 \sqrt{\pi}\left\|\sigma^{-1}\right\|\|b\|_{\infty}+\sqrt{9 \pi\left\|\sigma^{-1}\right\|^{2}\|b\|_{\infty}^{2}+6\|b\|_{\infty}}\right)^{2} \tag{2.11}
\end{equation*}
$$

then the following assertions hold.
(1) The following estimate holds:

$$
\mathbb{E}\left\|X_{t}^{\xi}-X_{t}^{\eta}\right\|_{\infty}^{2} \leq \inf _{\varepsilon \in(0,1), \lambda \geq \lambda_{0}} \mathrm{e}^{\frac{25}{8} \lambda_{1} r_{0}} \exp \left\{\mathrm{e}^{\frac{25}{8} \lambda_{1} r_{0}}\left(\Lambda(\lambda, \varepsilon)-\frac{25}{8} \lambda_{1} \mathrm{e}^{-\frac{25}{8} \lambda_{1} r_{0}}\right) t\right\} \frac{\|\xi-\eta\|_{\infty}^{2}}{1-\varepsilon}
$$

with

$$
\Lambda(\lambda, \varepsilon):=\frac{\frac{3}{4} \lambda+\frac{25}{16}\left\{\frac{2}{5} \lambda_{d}+\frac{72}{25} \lambda_{B}+\frac{12}{25} \Upsilon_{b, \sigma, \lambda, \alpha}\|B\|_{\infty}\right\}+\left(\frac{d}{16}+\frac{25}{16 \varepsilon}\right)\|\sigma\|^{2} \Upsilon_{b, \sigma, \lambda, \alpha}^{2}}{1-\varepsilon},
$$

and
$\Upsilon_{b, \sigma, \lambda, \alpha}=\Gamma\left(\frac{\alpha}{2}\right) \lambda^{-\frac{\alpha}{2}}\|\sigma\|^{\alpha}\left\|\sigma^{-1}\right\|^{2}\left(12 \kappa+4\|b\|_{\infty}+48\left(\left\|\sigma^{-1}\right\|^{2}+\left\|\sigma^{-1}\right\|\right)\left(3+\lambda^{-1}\right)\|b\|_{\infty}^{2}\right)$.
(2) If there exists $\tilde{\varepsilon} \in(0,1), \tilde{\lambda} \geq \lambda_{0}$ such that

$$
\Lambda(\tilde{\lambda}, \tilde{\varepsilon})<\frac{25}{8} \lambda_{1} \mathrm{e}^{-\frac{25}{8} \lambda_{1} r_{0}}
$$

then (1.3) has a unique invariant probability measure $\mu$ and for any $t_{0}>r_{0}$, $\max \left\{\mathbb{W}_{2}\left(P_{t}(\xi, \cdot), \mu\right), \operatorname{Ent}\left(P_{t}(\xi, \cdot) \mid \mu\right),\left\|P_{t}(\xi, \cdot)-\mu\right\|_{\text {var }}\right\} \leq \kappa_{1}(\xi) \mathrm{e}^{-\kappa_{2} t}, \quad \xi \in \mathscr{C}, t>t_{0}$ for some constants $\kappa_{1}(\xi), \kappa_{2}>0$, here $\kappa_{1}(\xi)$ means it depends on $\xi$.

Remark 2.4. Since $\sup _{\xi \in \mathscr{C}} \kappa_{1}(\xi)=\infty$ from the proof of Theorem 2.3 below, Theorem 2.3 can not imply the strong exponential ergodicity, i.e. there exist constants $\kappa_{1}, \kappa_{2}>0$ such that

$$
\sup _{\xi \in \mathscr{C}} \mathbb{W}_{2}\left(P_{t}(\xi, \cdot), \mu\right) \leq \kappa_{1} \mathrm{e}^{-\kappa_{2} t}
$$

On the other hand, there are a lot of examples where $\mathbb{W}_{2}\left(\mu_{n}, \mu_{0}\right)$ goes to 0 as $n$ goes to infinity, but $\mu_{n}$ is singular with respect to $\mu_{0}$ such that $\operatorname{Ent}\left(\mu_{n} \mid \mu_{0}\right)=\infty$ and $\left\|\mu_{n}-\mu_{0}\right\|_{\text {var }}=$ 1. Thus, the assertion in (2) is not trivial. Finally, [1, Theorem 1.1 (2),(3))] obtained the exponential convergence in relative entropy and $L^{2}(\mu)$ by the hyper-contractivity of $P_{t}$ for large enough $t$. However, it is difficult to establish hyper-contractivity of $P_{t}$ since the coupling property

$$
\left\|X_{t}^{\xi}-X_{t}^{\eta}\right\|_{\infty}^{2} \leq C \mathrm{e}^{-\lambda t}\|\xi-\eta\|_{\infty}^{2}
$$

does not hold due to the singularity of $b$.

## 3 Precise Estimate for Zvonkin's Transform

Since $b$ is singular, we need to construct a regular transform to remove $b$. To this end, for any $\lambda>0$, consider the following equation

$$
\begin{equation*}
u=\int_{0}^{\infty} \mathrm{e}^{-\lambda t} P_{t}^{0}\left\{b+\nabla_{b} u\right\} \mathrm{d} t \tag{3.1}
\end{equation*}
$$

where the semigroup $\left(P_{t}^{0}\right)_{t>0}$ is generated by $\left(Z_{t}^{x}\right)_{t \geq 0}$ which solves the SDE

$$
\begin{equation*}
\mathrm{d} Z_{t}^{x}=A Z_{t}^{x}+\sigma \mathrm{d} W(t), \quad Z_{0}^{x}=x \tag{3.2}
\end{equation*}
$$

The following lemma gives a precise estimate for the solution to (3.1), and it is very important in the proof of the exponential convergence.

Lemma 3.1. Under (H1), for any $\lambda \geq \lambda_{0}$ with $\lambda_{0}$ defined in (2.11),
(i) The equation (3.1) has a unique strong solution $\mathbf{u}^{\lambda} \in C_{b}^{1}\left(\mathbb{R}^{d} ; \mathbb{R}^{d}\right)$;
(ii) $\left\|\nabla \mathbf{u}^{\lambda}\right\|_{\infty} \leq \frac{1}{5}$;
(iii) $\left\|\nabla^{2} \mathbf{u}^{\lambda}\right\|_{\infty} \leq \frac{1}{5} \Upsilon_{b, \sigma, \lambda, \alpha}$ with $\Upsilon_{b, \sigma, \lambda, \alpha}$ defined in (2.12).

Proof. Firstly, it is easy to see that

$$
\nabla_{\eta} Z_{t}^{x}=\mathrm{e}^{A t} \eta, \quad \nabla_{\eta^{\prime}} \nabla_{\eta} Z_{t}^{x}=0, \quad t \geq 0
$$

This combining the Bismut formula [12, (2.8)] implies that

$$
\begin{align*}
\nabla_{\eta} P_{t}^{0} f(x) & =\mathbb{E}\left(\frac{f\left(Z_{t}^{x}\right)}{t} \int_{0}^{t}\left\langle\sigma^{-1} \nabla_{\eta} Z_{r}^{x}, \mathrm{~d} W(r)\right\rangle\right) \\
& =\mathbb{E}\left(\frac{f\left(Z_{t}^{x}\right)}{t} \int_{0}^{t}\left\langle\sigma^{-1} \mathrm{e}^{A r} \eta, \mathrm{~d} W(r)\right\rangle\right), \quad f \in \mathscr{B}_{b}\left(\mathbb{R}^{d}\right), t>0 \tag{3.3}
\end{align*}
$$

By the Cauchy-Schwartz inequality and Itô's isometry, we obtain that

$$
\begin{equation*}
\left|\nabla_{\eta} P_{t}^{0} f\right|^{2}(x) \leq \frac{\left\|\sigma^{-1}\right\|^{2}|\eta|^{2} P_{t}^{0} f^{2}(x)}{t}, \quad f \in \mathscr{B}_{b}\left(\mathbb{R}^{d}\right), t>0 \tag{3.4}
\end{equation*}
$$

(i) Let $\mathscr{H}=C_{b}^{1}\left(\mathbb{R}^{d} ; \mathbb{R}^{d}\right)$ ), which is a Banach space under the norm

$$
\|u\|_{\mathscr{H}}:=\|u\|_{\infty}+\|\nabla u\|_{\infty} .
$$

For any $\lambda>0, u \in \mathscr{H}$, define

$$
\left(\Gamma^{\lambda} u\right)(x)=\int_{0}^{\infty} \mathrm{e}^{-\lambda t} P_{t}^{0}\left(\nabla_{b} u+b\right)(x) \mathrm{d} t .
$$

Then we claim $\Gamma^{\lambda} \mathscr{H} \subset \mathscr{H}$ for any $\lambda>0$. In fact, for any $u \in \mathscr{H}$, it holds that

$$
\begin{aligned}
\left\|\Gamma^{\lambda} u\right\|_{\infty} & =\sup _{x \in \mathbb{R}^{d}}\left|\int_{0}^{\infty} \mathrm{e}^{-\lambda t} P_{t}^{0}\left(\nabla_{b} u+b\right)(x) \mathrm{d} t\right| \\
& \leq\left(\|b\|_{\infty}\|\nabla u\|_{\infty}+\|b\|_{\infty}\right) \int_{0}^{\infty} \mathrm{e}^{-\lambda t} \mathrm{~d} t \\
& \leq \frac{\|b\|_{\infty}\|\nabla u\|_{\infty}+\|b\|_{\infty}}{\lambda}<\infty
\end{aligned}
$$

By (3.4), we have

$$
\begin{aligned}
\left\|\nabla \Gamma^{\lambda} u\right\|_{\infty} & =\sup _{x \in \mathbb{R}^{d},|\eta| \leq 1}\left|\int_{0}^{\infty} \mathrm{e}^{-\lambda t} \nabla_{\eta} P_{t}^{0}\left(\nabla_{b} u+b\right)(x) \mathrm{d} t\right| \\
& \leq\left\|\sigma^{-1}\right\| \int_{0}^{\infty} \frac{\mathrm{e}^{-\lambda t}}{\sqrt{t}}\left(\|b\|_{\infty}\|\nabla u\|_{\infty}+\|b\|_{\infty}\right) \mathrm{d} t \\
& \leq\left\|\sigma^{-1}\right\|\left(\|b\|_{\infty}\|\nabla u\|_{\infty}+\|b\|_{\infty}\right) \int_{0}^{\infty} \frac{\mathrm{e}^{-\lambda t}}{\sqrt{t}} \mathrm{~d} t \\
& \leq \frac{\sqrt{\pi}\left\|\sigma^{-1}\right\|\left(\|b\|_{\infty}\|\nabla u\|_{\infty}+\|b\|_{\infty}\right)}{\sqrt{\lambda}}<\infty .
\end{aligned}
$$

So, $\Gamma^{\lambda} \mathscr{H} \subset \mathscr{H}$ for any $\lambda>0$. Next, by the fixed-point theorem, it suffices to show that for large enough $\lambda>0, \Gamma^{\lambda}$ is contractive on $\mathscr{H}$. To do this, for any $u, \tilde{u} \in \mathscr{H}$, similarly to the estimates of $\left\|\Gamma^{\lambda} u\right\|_{\infty}$ and $\left\|\nabla \Gamma^{\lambda} u\right\|_{\infty}$ above, we obtain that

$$
\begin{align*}
& \left\|\Gamma^{\lambda} u-\Gamma^{\lambda} \tilde{u}\right\|_{\infty} \leq \frac{\|b\|_{\infty}}{\lambda}\|\nabla u-\nabla \tilde{u}\|_{\infty} \\
& \left\|\nabla\left(\Gamma^{\lambda} u-\Gamma^{\lambda} \tilde{u}\right)\right\|_{\infty} \leq \frac{\sqrt{\pi}\left\|\sigma^{-1}\right\|\|b\|_{\infty}}{\sqrt{\lambda}}\|\nabla u-\nabla \tilde{u}\|_{\infty} . \tag{3.5}
\end{align*}
$$

Taking $\lambda>0$ satisfying

$$
\begin{equation*}
\frac{\sqrt{\pi}\left\|\sigma^{-1}\right\|\|b\|_{\infty}}{\sqrt{\lambda}}+\frac{\|b\|_{\infty}}{\lambda} \leq \frac{1}{6} \tag{3.6}
\end{equation*}
$$

then $\Gamma^{\lambda}$ is contractive on $\mathscr{H}$, which implies that (3.1) has a unique solution $\mathbf{u}^{\lambda} \in$ $C_{b}^{1}\left(\mathbb{R}^{d} ; \mathbb{R}^{d}\right)$ ) by the fixed-point theorem. Thus, from (3.6), (i) holds for

$$
\lambda \geq \lambda_{0}=\left(3 \sqrt{\pi}\left\|\sigma^{-1}\right\|\|b\|_{\infty}+\sqrt{9 \pi\left\|\sigma^{-1}\right\|^{2}\|b\|_{\infty}^{2}+6\|b\|_{\infty}}\right)^{2}
$$

(ii) For any $\lambda \geq \lambda_{0}$, one infers from (3.1) and (3.4) that

$$
\begin{aligned}
\left\|\nabla \mathbf{u}^{\lambda}\right\|_{\infty} & \leq \int_{0}^{\infty} \mathrm{e}^{-\lambda t}\left\|\nabla P_{t}^{0}\left\{b+\nabla_{b} \mathbf{u}^{\lambda}\right\}\right\|_{\infty} \mathrm{d} t \\
& \leq\left\|\sigma^{-1}\right\|\left(1+\left\|\nabla \mathbf{u}^{\lambda}\right\|_{\infty}\right)\|b\|_{\infty} \int_{0}^{\infty} \frac{\mathrm{e}^{-\lambda t}}{\sqrt{t}} \mathrm{~d} t \\
& \leq \lambda^{-\frac{1}{2}} \sqrt{\pi}\left\|\sigma^{-1}\right\|\|b\|_{\infty}\left(1+\left\|\nabla \mathbf{u}^{\lambda}\right\|_{\infty}\right)
\end{aligned}
$$

This and (3.6) yield (ii).
In the sequel, we intend to verify (iii). From (3.3) and the semigroup property, we have

$$
\begin{aligned}
\nabla_{\eta} P_{t}^{0} f(x) & =\nabla_{\eta} P_{t / 2}^{0}\left(P_{t / 2}^{0} f\right)(x) \\
& =\mathbb{E}\left(\frac{\left(P_{t / 2}^{0} f\right)\left(Z_{t / 2}^{x}\right)}{t / 2} \int_{0}^{\frac{t}{2}}\left\langle\sigma^{-1} \mathrm{e}^{A r} \eta, \mathrm{~d} W(r)\right\rangle\right), \quad t>0, f \in \mathscr{B}_{b}\left(\mathbb{R}^{d}\right) .
\end{aligned}
$$

This further gives that
$\frac{1}{2}\left(\nabla_{\eta^{\prime}} \nabla_{\eta} P_{t}^{0} f\right)(x)=\mathbb{E}\left(\frac{\left(\nabla_{\mathrm{e}^{A t / 2} \eta^{\prime}} P_{t / 2}^{0} f\right)\left(Z_{t / 2}^{x}\right)}{t} \int_{0}^{t / 2}\left\langle\sigma^{-1} \mathrm{e}^{A r} \eta, \mathrm{~d} W(r)\right\rangle\right), \quad t>0, f \in \mathscr{B}_{b}\left(\mathbb{R}^{d}\right)$, where we have used $\nabla_{\eta^{\prime}} Z_{t / 2}^{x}=\mathrm{e}^{A t / 2} \eta^{\prime}$. Thus, applying Cauchy-Schwartz's inequality and Itô's isometry and taking (3.4) into consideration, we derive that

$$
\begin{align*}
\left|\nabla_{\eta^{\prime}} \nabla_{\eta} P_{t}^{0} f\right|^{2}(x) & \leq \frac{4}{t}\left\|\sigma^{-1}\right\|^{2}|\eta|^{2} \frac{\left\|\sigma^{-1}\right\|^{2}\left|\eta^{\prime}\right|^{2} P_{t}^{0} f^{2}(x)}{t} \\
& =\frac{4\left\|\sigma^{-1}\right\|^{4}|\eta|^{2}\left|\eta^{\prime}\right|^{2} P_{t}^{0} f^{2}(x)}{t^{2}}, \quad t>0, f \in \mathscr{B}_{b}\left(\mathbb{R}^{d}\right) \tag{3.7}
\end{align*}
$$

Set $\tilde{h}(\cdot):=h(\cdot)-h(x)$ for fixed $x \in \mathbb{R}^{d}$ and $h \in \mathscr{B}_{b}\left(\mathbb{R}^{d}\right)$ which verifies

$$
\begin{equation*}
|h(x)-h(y)| \leq \tilde{\kappa}|x-y|^{\tilde{\alpha}}, \quad x, y \in \mathbb{R}^{d} \tag{3.8}
\end{equation*}
$$

for some $\tilde{\kappa}>0$ and $\tilde{\alpha} \in(0,1)$. Then (3.7) implies that

$$
\begin{align*}
\left|\nabla_{\eta^{\prime}} \nabla_{\eta} P_{t}^{0} h\right|^{2}(x)=\left|\nabla_{\eta^{\prime}} \nabla_{\eta} P_{t}^{0} \tilde{h}\right|^{2}(x) & \leq \frac{4\left\|\sigma^{-1}\right\|^{4}|\eta|^{2}\left|\eta^{\prime}\right|^{2}}{t^{2}} \mathbb{E}\left|h\left(Z_{t}^{x}\right)-h(x)\right|^{2} \\
& \leq \frac{4\left\|\sigma^{-1}\right\|^{4}|\eta|^{2}\left|\eta^{\prime}\right|^{2}}{t^{2}} \tilde{\kappa}^{2}\|\sigma\|^{2 \tilde{\alpha}} t^{\tilde{\alpha}}, \quad t>0 \tag{3.9}
\end{align*}
$$

where in the second display we have used that

$$
Z_{t}^{x}-x=\int_{0}^{t} \sigma \mathrm{~d} W(r)
$$

and utilized Jensen's inequality as well as Itô's isometry. Thus, if we can prove that

$$
\begin{equation*}
\left|\left(b+\nabla_{b} \mathbf{u}^{\lambda}\right)(x)-\left(b+\nabla_{b} \mathbf{u}^{\lambda}\right)(y)\right| \leq \tilde{\kappa}|x-y|^{\tilde{\alpha}}, \quad x, y \in \mathbb{R}^{d} \tag{3.10}
\end{equation*}
$$

for some $\tilde{\kappa}>0$ and $\tilde{\alpha} \in(0,1)$, we get from (3.1) and (3.9) that

$$
\begin{align*}
\left\|\nabla^{2} \mathbf{u}^{\lambda}\right\|_{\infty} & \leq 2\left\|\sigma^{-1}\right\|^{2} \tilde{\kappa}\|\sigma\|^{\tilde{\alpha}} \int_{0}^{\infty} \frac{\mathrm{e}^{-\lambda t}}{t} t^{\frac{\tilde{\alpha}}{2}} \mathrm{~d} t \\
& =2\left\|\sigma^{-1}\right\|^{2} \tilde{\kappa}\|\sigma\|^{\tilde{\alpha}} \lambda^{-\frac{\tilde{\alpha}}{2}} \int_{0}^{\infty} \frac{\mathrm{e}^{-t}}{t^{1-\frac{\tilde{\alpha}}{2}}} \mathrm{~d} t  \tag{3.11}\\
& =2\left\|\sigma^{-1}\right\|^{2} \tilde{\kappa}\|\sigma\|^{\tilde{\alpha}} \Gamma\left(\frac{\tilde{\alpha}}{2}\right) \lambda^{-\frac{\tilde{\alpha}}{2}} .
\end{align*}
$$

In the remaining, we intend to prove (3.10). Combining (3.4) and (3.7), we arrive at

$$
\begin{align*}
& \left\|\nabla P_{t}^{0} f(x)-\nabla P_{t}^{0} f(y)\right\| \\
& \leq\left(\frac{2\left\|\sigma^{-1}\right\|^{2}|x-y|}{t} \wedge \frac{2\left\|\sigma^{-1}\right\|}{\sqrt{t}}\right)\|f\|_{\infty}, \quad f \in \mathscr{B}_{b}\left(\mathbb{R}^{d}\right), t>0, x, y \in \mathbb{R}^{d} . \tag{3.12}
\end{align*}
$$

Thus, for any $f \in \mathscr{B}_{b}\left(\mathbb{R}^{d}\right), \lambda>0, x, y \in \mathbb{R}^{d}$, it holds that

$$
\begin{align*}
& \left\|\int_{0}^{\infty} \mathrm{e}^{-\lambda t}\left(\nabla P_{t}^{0} f(x)-\nabla P_{t}^{0} f(y)\right) \mathrm{d} t\right\| \\
& \leq\left(2\left\|\sigma^{-1}\right\|^{2}+2\left\|\sigma^{-1}\right\|\right)\|f\|_{\infty} \int_{0}^{\infty} \mathrm{e}^{-\lambda t}\left(\frac{|x-y|}{t} \wedge \frac{1}{\sqrt{t}}\right) \mathrm{d} t \\
& \leq\left(2\left\|\sigma^{-1}\right\|^{2}+2\left\|\sigma^{-1}\right\|\right)\|f\|_{\infty}\left(\int_{0}^{|x-y|^{2} \wedge \mathrm{e}^{-1}} \frac{1}{\sqrt{t}} \mathrm{~d} t\right.
\end{aligned} \quad \begin{aligned}
& \left.\quad+|x-y| \int_{|x-y|^{2} \wedge \mathrm{e}^{-1}}^{1} \frac{1}{t} \mathrm{~d} t+|x-y| \int_{1}^{\infty} \mathrm{e}^{-\lambda t} \mathrm{~d} t\right)  \tag{3.13}\\
& \leq\left(2\left\|\sigma^{-1}\right\|^{2}+2\left\|\sigma^{-1}\right\|\right)\|f\|_{\infty}\left(\left(2+\lambda^{-1}\right)|x-y|+|x-y| \log \left(|x-y|^{-2} \vee \mathrm{e}\right)\right) \\
& \leq\left(2\left\|\sigma^{-1}\right\|^{2}+2\left\|\sigma^{-1}\right\|\right)\|f\|_{\infty}\left(3+\lambda^{-1}\right)|x-y| \log \left(|x-y|^{-2}+\mathrm{e}\right) .
\end{align*}
$$

For any $\lambda \geq \lambda_{0}$, note from (2.2), (ii), (3.1), (3.4), (3.7) and (3.13) that

$$
\begin{aligned}
&\left|\left(b+\nabla_{b} \mathbf{u}^{\lambda}\right)(x)-\left(b+\nabla_{b} \mathbf{u}^{\lambda}\right)(y)\right| \\
& \leq\left(1+\left\|\nabla \mathbf{u}^{\lambda}\right\|_{\infty}\right) \kappa|x-y|^{\alpha}+\|b\|_{\infty}\left\|\nabla \mathbf{u}^{\lambda}(x)-\nabla \mathbf{u}^{\lambda}(y)\right\| \mathbf{1}_{\{|x-y| \geq 1\}} \\
&+\|b\|_{\infty}\left\|\nabla \mathbf{u}^{\lambda}(x)-\nabla \mathbf{u}^{\lambda}(y)\right\| \mathbf{1}_{\{|x-y| \leq 1\}} \\
& \leq \frac{6}{5} \kappa|x-y|^{\alpha}+\frac{2}{5}\|b\|_{\infty}|x-y|^{\alpha} \mathbf{1}_{\{|x-y| \geq 1\}} \\
&+\frac{6}{5}\left(2\left\|\sigma^{-1}\right\|^{2}+2\left\|\sigma^{-1}\right\|\right)\left(3+\lambda^{-1}\right)\|b\|_{\infty}^{2}|x-y|^{\alpha} \\
& \times|x-y|^{1-\alpha} \log \left(\mathrm{e}+\frac{1}{|x-y|^{2}}\right) \mathbf{1}_{\{|x-y| \leq 1\}} \\
& \leq\left(\frac{6}{5} \kappa+\frac{2}{5}\|b\|_{\infty}+\frac{24}{5}\left(\left\|\sigma^{-1}\right\|^{2}+\left\|\sigma^{-1}\right\|\right)\left(3+\lambda^{-1}\right)\|b\|_{\infty}^{2}\right)|x-y|^{\alpha}
\end{aligned}
$$

where in the third inequality we have used the fact that the function $[0,1] \ni x \mapsto$ $x^{1-\alpha} \log \left(\mathrm{e}+\frac{1}{x^{2}}\right)$ is non-decreasing. Thus, (3.10) holds for $\tilde{\kappa}=\frac{6}{5} \kappa+\frac{2}{5}\|b\|_{\infty}+\frac{24}{5}\left(\left\|\sigma^{-1}\right\|^{2}+\right.$ $\left.\left\|\sigma^{-1}\right\|\right)\left(3+\lambda^{-1}\right)\|b\|_{\infty}^{2}$ and $\tilde{\alpha}=\alpha$. From (3.11), we finish the proof.
Remark 3.2. In the multiplicative noise case, $\nabla_{\eta} Z_{t}^{x}$ is a random variable, precise estimate for the solution of (3.1), especially $\left\|\nabla^{2} \mathbf{u}^{\lambda}\right\|_{\infty}$, is so sophisticated that we only consider the additive noise case in this paper.

## 4 Proof of Theorem 2.3

Lemma 4.1. Assume (H1)-(H2) and

$$
\lambda_{B}<\lambda_{1} \mathrm{e}^{-2 \lambda_{1} r_{0}},
$$

then

$$
\begin{equation*}
\sup _{t \geq 0} \mathbb{E}\left\|X_{t}^{\xi}\right\|_{\infty}^{2}<\infty \tag{4.1}
\end{equation*}
$$

Proof. For simplicity, we denote $X^{\xi}(t)$ by $X(t)$. Itô's formula implies that

$$
\begin{aligned}
\mathrm{d}|X(t)|^{2}= & 2\langle X(t), A X(t))\rangle \mathrm{d} t+2\langle X(t), b(X(t))\rangle \mathrm{d} t+2\langle X(t), \sigma \mathrm{d} W(t)\rangle \\
& +2\left\langle X(t), B\left(X_{t}\right)\right\rangle \mathrm{d} t+\|\sigma\|_{H S}^{2} \mathrm{~d} t .
\end{aligned}
$$

Let $\xi_{0}(s)=0, s \in\left[-r_{0}, 0\right]$. It follows from (2.3) that

$$
\left\langle X(t), B\left(X_{t}\right)\right\rangle \leq\left|X ( t ) \left\|B ( X _ { t } ) \left|\leq \lambda_{B}\left\|X_{t}\right\|_{\infty}^{2}+\left|B\left(\xi_{0}\right) \| X(t)\right|\right.\right.\right.
$$

Since $\lambda_{B}<\lambda_{1} \mathrm{e}^{-2 \lambda_{1} r_{0}}$, we can take small enough $\varepsilon \in(0,1)$ and $\epsilon \in\left(0,2 \lambda_{1}\right)$ such that

$$
\frac{2 \lambda_{B}}{1-\varepsilon}<\left(2 \lambda_{1}-\epsilon\right) \mathrm{e}^{-\left(2 \lambda_{1}-\epsilon\right) r_{0}} .
$$

This together with Young's inequality and (H2) yields that

$$
\begin{align*}
\mathrm{d}|X(t)|^{2} & \leq-2 \lambda_{1}|X(t)|^{2} \mathrm{~d} t+\left\{2\left(\|b\|_{\infty}+\left|B\left(\xi_{0}\right)\right|\right)|X(t)|+\|\sigma\|_{H S}^{2}\right\} \mathrm{d} t \\
& +2 \lambda_{B}\left\|X_{t}\right\|_{\infty}^{2} \mathrm{~d} t+2\langle X(t), \sigma \mathrm{d} W(t)\rangle \\
& \leq\left(-2 \lambda_{1}+\epsilon\right)|X(t)|^{2} \mathrm{~d} t+\left\{\frac{1}{\epsilon}\left(\|b\|_{\infty}+\left|B\left(\xi_{0}\right)\right|\right)^{2}+\|\sigma\|_{H S}^{2}\right\} \mathrm{d} t  \tag{4.2}\\
& +2 \lambda_{B}\left\|X_{t}\right\|_{\infty}^{2} \mathrm{~d} t+2\langle X(t), \sigma \mathrm{d} W(t)\rangle .
\end{align*}
$$

Thus it is not difficult to see that

$$
\begin{aligned}
\mathrm{de}^{\left(2 \lambda_{1}-\epsilon\right) t}|X(t)|^{2} \mathrm{~d} t & \leq 2 \lambda_{B} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) t}\left\|X_{t}\right\|_{\infty}^{2} \mathrm{~d} t \\
& +\mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) t}\left\{\frac{1}{\epsilon}\left(\|b\|_{\infty}+\left|B\left(\xi_{0}\right)\right|\right)^{2}+\|\sigma\|_{H S}^{2}\right\} \mathrm{d} t \\
& +2 \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) t}\langle X(t), \sigma \mathrm{d} W(t)\rangle .
\end{aligned}
$$

Let $\eta_{r}=\sup _{s \in\left[-r_{0}, r\right]} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) s^{+}}|X(s)|^{2}$, then

$$
\begin{align*}
\mathbb{E} \eta_{r} & \leq\|\xi\|_{\infty}^{2}+2 \lambda_{B} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) r_{0}} \mathbb{E} \int_{0}^{r} \eta_{t} \mathrm{~d} t \\
& +\int_{0}^{r} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) t}\left\{\frac{1}{\epsilon}\left(\|b\|_{\infty}+\left|B\left(\xi_{0}\right)\right|\right)^{2}+\|\sigma\|_{H S}^{2}\right\} \mathrm{d} t  \tag{4.4}\\
& +\mathbb{E} \sup _{s \in[0, r]} \int_{0}^{s} 2 \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) t}\langle X(t), \sigma \mathrm{d} W(t)\rangle
\end{align*}
$$

On the other hand, BDG inequality and Young's inequality imply that

$$
\begin{align*}
& \mathbb{E} \sup _{s \in[0, r]} \int_{0}^{s} 2 \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) t}\langle X(t), \sigma \mathrm{d} W(t)\rangle \\
& \leq \mathbb{E}\left\{\int_{0}^{r} 16 \mathrm{e}^{\left(4 \lambda_{1}-2 \epsilon\right) t}\|\sigma\|^{2}|X(t)|^{2} \mathrm{~d} t\right\}^{\frac{1}{2}}  \tag{4.5}\\
& \leq \varepsilon \mathbb{E} \eta_{r}+\int_{0}^{r} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) t} \times \frac{4\|\sigma\|^{2}}{\varepsilon} \mathrm{~d} t .
\end{align*}
$$

Let $\beta:=\frac{\frac{1}{\epsilon}\left(\|b\|_{\infty}+\left|B\left(\xi_{0}\right)\right|\right)^{2}+\|\sigma\|_{H S}^{2}+\frac{4\|\sigma\|^{2}}{\varepsilon}}{1-\varepsilon}$. Combining (4.4) and (4.5), we have

$$
\begin{equation*}
\mathbb{E} \eta_{r} \leq \frac{\|\xi\|_{\infty}^{2}}{1-\varepsilon}+\frac{2 \lambda_{B} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) r_{0}}}{1-\varepsilon} \mathbb{E} \int_{0}^{r} \eta_{t} \mathrm{~d} t+\beta \int_{0}^{r} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) t} \mathrm{~d} t \tag{4.6}
\end{equation*}
$$

By (2.4), Gronwall's inequality implies that

$$
\begin{align*}
\mathbb{E} \eta_{t} \leq & \exp \left\{\frac{2 \lambda_{B} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) r_{0}}}{1-\varepsilon} t\right\} \frac{\|\xi\|_{\infty}^{2}}{1-\varepsilon} \\
& +\beta \int_{0}^{t} \exp \left\{\frac{2 \lambda_{B} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) r_{0}}}{1-\varepsilon}(t-s)+\left(2 \lambda_{1}-\epsilon\right) s\right\} \mathrm{d} s \tag{4.7}
\end{align*}
$$

Noting that $\mathbb{E} \eta_{t} \geq \mathrm{e}^{\left(t-r_{0}\right)\left(2 \lambda_{1}-\epsilon\right)} \mathbb{E}\left\|X_{t}\right\|_{\infty}^{2}$, we obtain that

$$
\begin{align*}
\mathbb{E}\left\|X_{t}\right\|_{\infty}^{2} & \leq \mathrm{e}^{r_{0}\left(2 \lambda_{1}-\epsilon\right)} \exp \left\{\left(\frac{2 \lambda_{B} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) r_{0}}}{1-\varepsilon}-\left(2 \lambda_{1}-\epsilon\right)\right) t\right\} \frac{\|\xi\|_{\infty}^{2}}{1-\varepsilon} \\
& +\mathrm{e}^{r_{0}\left(2 \lambda_{1}-\epsilon\right)} \beta \int_{0}^{t} \exp \left\{\left(\frac{2 \lambda_{B} \mathrm{e}^{\left(2 \lambda_{1}-\epsilon\right) r_{0}}}{1-\varepsilon}-\left(2 \lambda_{1}-\epsilon\right)\right)(t-s)\right\} \mathrm{d} s . \tag{4.8}
\end{align*}
$$

Since $\frac{2 \lambda_{B}}{1-\varepsilon}<\left(2 \lambda_{1}-\epsilon\right) \mathrm{e}^{-\left(2 \lambda_{1}-\epsilon\right) r_{0}}$, we conclude that (4.1) holds.
Proof of Theorem 2.3. (1) Let $X$ and $\bar{X}$ be solutions to (1.3) with $X_{0}=\xi, \bar{X}_{0}=\eta$, then

$$
\begin{align*}
\mathrm{d} X(t) & =\left\{A X(t)+b(X(t))+B\left(X_{t}\right)\right\} \mathrm{d} t+\sigma \mathrm{d} W(t), & X_{0}=\xi, \\
\mathrm{d} \bar{X}(t) & =\left\{A X(t)+b(\bar{X}(t))+B\left(\bar{X}_{t}\right)\right\} \mathrm{d} t+\sigma \mathrm{d} W(t), & \bar{X}_{0}=\eta . \tag{4.9}
\end{align*}
$$

For any $\lambda \geq \lambda_{0}$, let $\theta^{\lambda}(x)=x+\mathbf{u}^{\lambda}(x)$. Combining (3.1) and Lemma 3.1, we have

$$
\begin{equation*}
\frac{1}{2} \operatorname{Tr}\left(\sigma \sigma^{*} \nabla^{2} \mathbf{u}^{\lambda}\right)+\nabla_{b} \mathbf{u}^{\lambda}+b+\nabla_{A} \cdot \mathbf{u}^{\lambda}=\lambda \mathbf{u}^{\lambda} . \tag{4.10}
\end{equation*}
$$

By (4.9), (4.10) and Itô's formula, we have

$$
\mathrm{d} \theta^{\lambda}(X(t))=\left\{A X(t)+\lambda \mathbf{u}^{\lambda}(X(t))+\nabla \theta^{\lambda}(X(t)) B\left(X_{t}\right)\right\} \mathrm{d} t+\nabla \theta^{\lambda}(X(t)) \sigma \mathrm{d} W(t)
$$

$$
\mathrm{d} \theta^{\lambda}(\bar{X}(t))=\left\{A \bar{X}(t)+\lambda \mathbf{u}^{\lambda}(\bar{X}(t))+\nabla \theta^{\lambda}(\bar{X}(t)) B\left(\bar{X}_{t}\right)\right\} \mathrm{d} t+\nabla \theta^{\lambda}(\bar{X}(t)) \sigma \mathrm{d} W(t)
$$

So, letting $\xi(t)=\theta^{\lambda}(X(t))-\theta^{\lambda}(\bar{X}(t))$, we arrive at

$$
\begin{align*}
\mathrm{d}|\xi(t)|^{2}= & 2\left\langle A X(t)-A \bar{X}(t), \theta^{\lambda}(X(t))-\theta^{\lambda}(\bar{X}(t))\right\rangle \\
& 2 \lambda\left\langle\xi(t), \mathbf{u}^{\lambda}(X(t))-\mathbf{u}^{\lambda}(\bar{X}(t))\right\rangle \mathrm{d} t \\
& +2\left\langle\xi(t),\left[\nabla \theta^{\lambda}(X(t)) B\left(X_{t}\right)-\nabla \theta^{\lambda}(\bar{X}(t)) B\left(\bar{X}_{t}\right)\right]\right\rangle \mathrm{d} t  \tag{4.11}\\
& +2\left\langle\xi(t),\left[\nabla \theta^{\lambda}(X(t))-\nabla \theta^{\lambda}(\bar{X}(t))\right] \sigma \mathrm{d} W(t)\right\rangle \\
& +\left\|\left[\nabla \theta^{\lambda}(X(t))-\nabla \theta^{\lambda}(\bar{X}(t))\right] \sigma\right\|_{H S}^{2} \mathrm{~d} t
\end{align*}
$$

Firstly, it is easy to see that

$$
\begin{aligned}
& 2\left\langle A X(t)-A \bar{X}(t), \theta^{\lambda}(X(t))-\theta^{\lambda}(\bar{X}(t))\right\rangle \\
= & 2\left\langle A X(t)-A \bar{X}(t), X(t)-\bar{X}(t)+\mathbf{u}^{\lambda}(X(t))-\mathbf{u}^{\lambda}(\bar{X}(t))\right\rangle \\
\leq & -2 \lambda_{1}|X(t)-\bar{X}(t)|^{2}+\frac{2 \lambda_{d}}{5}|X(t)-\bar{X}(t)|^{2}
\end{aligned}
$$

By Lemma 3.1 and (H2), it holds that

$$
\begin{aligned}
& 2\left\langle\xi(t),\left[\nabla \theta^{\lambda}(X(t)) B\left(X_{t}\right)-\nabla \theta^{\lambda}(\bar{X}(t)) B\left(\bar{X}_{t}\right)\right]\right\rangle \\
& \leq \frac{12}{5}|X(t)-\bar{X}(t)|\left\|\nabla \theta^{\lambda}(X(t))-\nabla \theta^{\lambda}(\bar{X}(t))\right\|\left|B\left(X_{t}\right)\right| \\
& +\frac{12}{5}|X(t)-\bar{X}(t)|\left\|\nabla \theta^{\lambda}(\bar{X}(t))\right\|\left|B\left(X_{t}\right)-B\left(\bar{X}_{t}\right)\right| \\
& \leq \frac{12}{25} \Upsilon_{b, \sigma, \lambda, \alpha}\|B\|_{\infty}|X(t)-\bar{X}(t)|^{2}+\frac{72}{25} \lambda_{B}\left\|X_{t}-\bar{X}_{t}\right\|_{\infty}^{2}
\end{aligned}
$$

and

$$
\begin{equation*}
2 \lambda|\xi(t)| \cdot\left|\mathbf{u}^{\lambda}(X(t))-\mathbf{u}^{\lambda}(\bar{X}(t))\right| \leq \frac{12}{25} \lambda|X(t)-\bar{X}(t)|^{2} \tag{4.12}
\end{equation*}
$$

Moreover,

$$
\begin{equation*}
\left\|\left[\nabla \theta^{\lambda}(X(t))-\nabla \theta^{\lambda}(\bar{X}(t))\right] \sigma\right\|_{H S}^{2} \leq \frac{1}{25} \Upsilon_{b, \sigma, \lambda, \alpha}^{2}\|\sigma\|_{H S}^{2}|X(t)-\bar{X}(t)|^{2} \tag{4.13}
\end{equation*}
$$

Let

$$
\Lambda_{1}(\lambda):=\frac{3}{4} \lambda+\frac{25}{16}\left\{\frac{2}{5} \lambda_{d}+\frac{72}{25} \lambda_{B}+\frac{12}{25} \Upsilon_{b, \sigma, \lambda, \alpha}\|B\|_{\infty}+\frac{1}{25} \Upsilon_{b, \sigma, \lambda, \alpha}^{2}\|\sigma\|_{H S}^{2}\right\}
$$

Since $\left\|\nabla \theta^{\lambda}(x)\right\| \geq \frac{4}{5}$ for any $x \in \mathbb{R}^{d}$, we have

$$
\begin{align*}
\mathrm{d}|X(t)-\bar{X}(t)|^{2} & \leq-\frac{25}{8} \lambda_{1}|X(t)-\bar{X}(t)|^{2} \mathrm{~d} t \\
& +\Lambda_{1}(\lambda)\left\|X_{t}-\bar{X}_{t}\right\|_{\infty}^{2} \mathrm{~d} t  \tag{4.14}\\
& +\frac{25}{8}\left\langle\xi(t),\left[\nabla \theta^{\lambda}(X(t))-\nabla \theta^{\lambda}(\bar{X}(t))\right] \sigma \mathrm{d} W(t)\right\rangle
\end{align*}
$$

Similarly to (4.3), it holds that

$$
\begin{aligned}
\mathrm{de}^{\frac{25}{8} \lambda_{1} t}|X(t)-\bar{X}(t)|^{2} \mathrm{~d} t & \leq \Lambda_{1}(\lambda) \mathrm{e}^{\frac{25}{8} \lambda_{1} t}\left\|X_{t}-\bar{X}_{t}\right\|_{\infty}^{2} \\
& +\frac{25}{8} \mathrm{e}^{\frac{25}{8} \lambda_{1} t}\left\langle\xi(t),\left[\nabla \theta^{\lambda}(X(t))-\nabla \theta^{\lambda}(\bar{X}(t))\right] \sigma \mathrm{d} W(t)\right\rangle .
\end{aligned}
$$

Set $\gamma_{r}=\sup _{s \in\left[-r_{0}, r\right]} \mathrm{e}^{\frac{25}{8} \lambda_{1} s^{+}}|X(s)-\bar{X}(s)|^{2}$ and we get

$$
\begin{align*}
\mathbb{E} \gamma_{r} & \leq\|\xi-\eta\|_{\infty}^{2}+\Lambda_{1}(\lambda) \mathrm{e}^{\frac{25}{8} \lambda_{1} r_{0}} \mathbb{E} \int_{0}^{r} \gamma_{t} \mathrm{~d} t \\
& +\mathbb{E} \sup _{s \in[0, r]} \int_{0}^{s} \frac{25}{8} \mathrm{e}^{\frac{25}{8} \lambda_{1} t}\left\langle\xi(t),\left[\nabla \theta^{\lambda}(X(t))-\nabla \theta^{\lambda}(\bar{X}(t))\right] \sigma \mathrm{d} W(t)\right\rangle . \tag{4.15}
\end{align*}
$$

Again, BDG inequality and Young's inequality yield that for any $\varepsilon \in(0,1)$,

$$
\begin{align*}
& \mathbb{E} \sup _{s \in[0, r]} \int_{0}^{s} \frac{25}{8} \mathrm{e}^{\frac{25}{8} \lambda_{1} t}\left\langle\xi(t),\left[\nabla \theta^{\lambda}(X(t))-\nabla \theta^{\lambda}(\bar{X}(t))\right] \sigma \mathrm{d} W(t)\right\rangle \\
& \leq 2 \mathbb{E}\left\{\int_{0}^{r} \frac{625}{64} \mathrm{e}^{\frac{25}{4} \lambda_{1} t}\left|\sigma^{*}\left[\nabla \theta^{\lambda}(X(t))-\nabla \theta^{\lambda}(\bar{X}(t))\right]^{*} \xi(t)\right|^{2} \mathrm{~d} t\right\}^{\frac{1}{2}} \\
& \leq 2 \mathbb{E} \sqrt{\frac{25}{16} \Upsilon_{b, \sigma, \lambda, \alpha}^{2}\|\sigma\|^{2} \int_{0}^{r} \mathrm{e}^{\frac{25}{4} \lambda_{1} t}|X(t)-\bar{X}(t)|^{4} \mathrm{~d} t}  \tag{4.16}\\
& \leq \varepsilon \mathbb{E} \gamma_{r}+\frac{25 \Upsilon_{b, \sigma, \lambda, \alpha}^{2}}{16 \varepsilon}\|\sigma\|^{2} \mathbb{E} \int_{0}^{r} \gamma_{t} \mathrm{~d} t .
\end{align*}
$$

Substituting (4.16) into (4.15), we obtain

$$
\begin{equation*}
\mathbb{E} \gamma_{r} \leq \frac{\|\xi-\eta\|_{\infty}^{2}}{1-\varepsilon}+\frac{\Lambda_{1}(\lambda) \mathrm{e}^{\frac{25}{8} \lambda_{1} r_{0}}+\frac{25 \Upsilon_{b, \sigma, \lambda, \alpha}^{2}}{16 \varepsilon}\|\sigma\|^{2}}{1-\varepsilon} \mathbb{E} \int_{0}^{r} \gamma_{t} \mathrm{~d} t . \tag{4.17}
\end{equation*}
$$

Again by (2.4), Gronwall's inequality implies that

$$
\begin{equation*}
\mathbb{E} \gamma_{t} \leq \exp \left\{\frac{\Lambda_{1}(\lambda) \mathrm{e}^{\frac{25}{8} \lambda_{1} r_{0}}+\frac{25 \Upsilon_{b, \sigma, \lambda, \alpha}^{2}}{16 \varepsilon}\|\sigma\|^{2}}{1-\varepsilon} t\right\} \frac{\|\xi-\eta\|_{\infty}^{2}}{1-\varepsilon} \tag{4.18}
\end{equation*}
$$

Noting that $\mathbb{E} \gamma_{t} \geq \mathrm{e}^{\left(t-r_{0}\right) \frac{25}{8} \lambda_{1}} \mathbb{E}\left\|X_{t}-\bar{X}_{t}\right\|_{\infty}^{2}$, we obtain

$$
\begin{align*}
& \mathbb{E}\left\|X_{t}-\bar{X}_{t}\right\|_{\infty}^{2} \\
& \leq \mathrm{e}^{\frac{25}{8} \lambda_{1} r_{0}} \exp \left\{\mathrm{e}^{\frac{25}{8} \lambda_{1} r_{0}}\left(\frac{\Lambda_{1}(\lambda)+\frac{25 \Upsilon_{, \text {, } \sigma, \lambda, \alpha}^{2}}{16 \varepsilon}\|\sigma\|^{2}}{1-\varepsilon}-\frac{25}{8} \lambda_{1} \mathrm{e}^{-\frac{25}{8} \lambda_{1} r_{0}}\right) t\right\} \frac{\|\xi-\eta\|_{\infty}^{2}}{1-\varepsilon} . \tag{4.19}
\end{align*}
$$

Thus, letting

$$
\Lambda(\lambda, \varepsilon):=\frac{\Lambda_{1}(\lambda)+\frac{25 \Upsilon_{b, \sigma, \lambda, \alpha}^{2}}{16 \varepsilon}\|\sigma\|^{2}}{1-\varepsilon}
$$

combining the definition of $\Lambda_{1}(\lambda)$ and noting $\|\sigma\|_{H S}^{2} \leq d\|\sigma\|^{2}$, we prove (1).
(2) Now, if there exists $\tilde{\varepsilon} \in(0,1), \tilde{\lambda} \geq \lambda_{0}$ such that

$$
\Lambda(\tilde{\lambda}, \tilde{\varepsilon})<\frac{25}{8} \lambda_{1} \mathrm{e}^{-\frac{25}{8} \lambda_{1} r_{0}}
$$

then there exists constants $\kappa_{0}, \kappa_{2}>0$ such that

$$
\begin{equation*}
\mathbb{W}_{2}\left(P_{t}\left(\xi, \cdot, P_{t}(\eta, \cdot)\right)^{2} \leq \mathbb{E}\left\|X_{t}-\bar{X}_{t}\right\|_{\infty}^{2} \leq \kappa_{0} \mathrm{e}^{-\kappa_{2} t}\|\xi-\eta\|_{\infty}^{2}\right. \tag{4.20}
\end{equation*}
$$

This yields that for any $0<t<s$,

$$
\begin{equation*}
\mathbb{E}\left\|X_{t}^{\xi}-X_{s}^{\xi}\right\|_{\infty}^{2}=\mathbb{E}\left\|X_{t}^{\xi}-X_{t}^{X_{s-t}^{\xi}}\right\|_{\infty}^{2} \leq \kappa_{0} \mathrm{e}^{-\kappa_{2} t} \mathbb{E}\left\|\xi-X_{s-t}^{\xi}\right\|_{\infty}^{2} \tag{4.21}
\end{equation*}
$$

Noting that $\Lambda(\tilde{\lambda}, \tilde{\varepsilon}) \geq \frac{\Lambda_{1}(\lambda)}{1-\tilde{\varepsilon}} \geq \frac{\frac{25}{8} \lambda_{B}}{1-\tilde{\varepsilon}}$ and

$$
\Lambda(\tilde{\lambda}, \tilde{\varepsilon})<\frac{25}{8} \lambda_{1} \mathrm{e}^{-\frac{25}{8} \lambda_{1} r_{0}}
$$

we conclude that

$$
\lambda_{B}<\lambda_{1} \mathrm{e}^{-2 \lambda_{1} r_{0}}
$$

According to Lemma 4.1, it holds that

$$
\sup _{r \geq 0} \mathbb{E}\left\|X_{r}^{\xi}\right\|_{\infty}^{2}<\infty
$$

Thus,

$$
\begin{equation*}
\mathbb{W}_{2}\left(P_{t}(\xi, \cdot), P_{s}(\xi, \cdot)\right)^{2} \leq \mathbb{E}\left\|X_{t}^{\xi}-X_{s}^{\xi}\right\|_{\infty}^{2} \leq \kappa_{1}(\xi) \mathrm{e}^{-\kappa_{2} t} \tag{4.22}
\end{equation*}
$$

holds for some positive constant $\kappa_{1}(\xi)$ depending on $\xi$. So, there exists a probability measure $\mu_{\xi}$ such that

$$
\begin{equation*}
\mathbb{W}_{2}\left(P_{t}(\xi, \cdot), \mu_{\xi}\right)^{2} \leq \kappa_{1}(\xi) \mathrm{e}^{-\kappa_{2} t} \tag{4.23}
\end{equation*}
$$

It remains to prove that $\mu_{\xi}$ does not depend on $\xi$. For any $\xi, \eta \in \mathscr{C}$,

$$
\begin{align*}
\mathbb{W}_{2}\left(\mu_{\xi}, \mu_{\eta}\right)^{2} & \leq \mathbb{W}_{2}\left(P_{t}(\xi, \cdot), \mu_{\xi}\right)^{2}+\mathbb{W}_{2}\left(P_{t}(\xi, \cdot), P_{t}(\eta, \cdot)\right)^{2}+\mathbb{W}_{2}\left(P_{t}(\eta, \cdot), \mu_{\eta}\right)^{2} \\
& \leq \kappa_{1}(\xi) \mathrm{e}^{-\kappa_{2} t}+\kappa_{0} \mathrm{e}^{-\kappa_{2} t}\|\xi-\eta\|_{\infty}^{2}+\kappa_{1}(\eta) \mathrm{e}^{-\kappa_{2} t} \tag{4.24}
\end{align*}
$$

Letting $t \rightarrow \infty$, we obtain $\mu_{\xi}=\mu_{\eta}$.
Next, for any $t_{0}>r_{0}$ and $t>t_{0}$, by the semigroup property, (2.9) and (4.22), we have

$$
\begin{aligned}
\operatorname{Ent}\left(P_{t}(\xi, \cdot) \mid P_{t}(\eta, \cdot)\right) & =\operatorname{Ent}\left(P_{t-t_{0}}(\xi, \cdot) P_{t_{0}} \mid P_{t-t_{0}}(\eta, \cdot) P_{t_{0}}\right) \\
& \leq \frac{C\left(t_{0}\right)}{\left(t_{0}-r_{0}\right) \wedge 1} \mathbb{W}_{2}\left(P_{t-t_{0}}(\xi, \cdot), P_{t-t_{0}}(\eta, \cdot)\right)^{2} \\
& \leq \frac{C\left(t_{0}\right)}{\left(t_{0}-r_{0}\right) \wedge 1} \kappa_{0} \mathrm{e}^{\kappa_{2} t_{0}} \mathrm{e}^{-\kappa_{2} t}\|\xi-\eta\|_{\infty}^{2} .
\end{aligned}
$$

Thus (1.2) implies that for any $t>t_{0}$,

$$
\begin{equation*}
\left\|P_{t}(\xi, \cdot)-P_{t}(\eta, \cdot)\right\|_{v a r}^{2} \leq \frac{C\left(t_{0}\right)}{2\left(t_{0}-r_{0}\right) \wedge 2} \kappa_{0} \mathrm{e}^{\kappa_{2} t_{0}} \mathrm{e}^{-\kappa_{2} t}\|\xi-\eta\|_{\infty}^{2} \tag{4.25}
\end{equation*}
$$

Combining (2.9), (2.10), (4.23) and the semigroup property, since $\mu$ is the invariant probability measure, we have

$$
\begin{aligned}
\operatorname{Ent}\left(P_{t}(\xi, \cdot) \mid \mu\right) & =\operatorname{Ent}\left(P_{t-t_{0}}(\xi, \cdot) P_{t_{0}} \mid \mu P_{t_{0}}\right) \\
& \leq \frac{C\left(t_{0}\right)}{\left(t_{0}-r_{0}\right) \wedge 1} \mathbb{W}_{2}\left(P_{t-t_{0}}(\xi, \cdot), \mu\right)^{2} \\
& \leq \frac{C\left(t_{0}\right)}{\left(t_{0}-r_{0}\right) \wedge 1} \kappa_{1}(\xi) \mathrm{e}^{\kappa_{2} t_{0}} \mathrm{e}^{-\kappa_{2} t} .
\end{aligned}
$$

and

$$
\left\|P_{t}(\xi, \cdot)-\mu\right\|_{v a r}^{2} \leq \frac{C\left(t_{0}\right)}{2\left(t_{0}-r_{0}\right) \wedge 2} \kappa_{1}(\xi) \mathrm{e}^{\kappa_{2} t_{0}} \mathrm{e}^{-\kappa_{2} t}
$$

Thus, we complete the proof.
