REGULARITY AND SCATTERING OF DISPERSIVE WAVE EQUATIONS

MULTIPLIER METHOD AND MORAWETZ ESTIMATE

The book covers the global behavior of dispersive wave equations and illustrates the development of fundamental mathematical tools, such as the energy method and Morawetz estimates, by applying modern harmonic analysis theory. It then discusses the well-posedness and scattering theory of solutions to nonlinear wave and Klein-Gordon/Schrodinger equations. The book also includes Bourgain's energy induction method, inward/outward energy theory and a brief introduction of the comapctness-rigidity argument.

THE SERIES: DE GRUYTER STUDIES IN MATHEMATICS
The series is devoted to the publication of monographs and high-level textbooks in mathematics, mathematical methods, and their applications. Apart from covering important areas of current interest, a major aim is to make topics of an interdisciplinary nature accessible to the non-specialist.

The works in this series are addressed to advanced students and researchers in mathematics and theoretical physics. In addition, it can serve as a guide for lectures and seminars on a graduate level.
